

Take a Peek At Digital Dentistry

Dr. Kwang Moo Koh

Digital dentistry is rapidly developing and becoming popular. Intraoral scanners are recognized as one of the basic equipment to be purchased at the time of opening, and more and more dentists are designing and manufacturing dental prosthetics in dental clinics using CAD/CAM system. This is because access to digital dentistry has become much easier than in the past due to the continuous development of software and hardware and diversified educational opportunities.

I'm using digital dentistry since 2014 and continue to learn and use it in daily clinical practice. Based on the experience, I would like to introduce the process and realistic aspects of digital dentistry, hoping that it can give a glimpse of other dentists and even a small help to those who are still worried about or unable to use digital.
