

## Boosting Your Panoramic Diagnostic Skills by 200% : Don't Miss the Subtle Clues

Prof. Che Na Lee

Panoramic radiography is a unique imaging modality exclusively utilized in dentistry and remains one of the most widely used diagnostic tools in routine dental practice. Although dentists frequently rely on panoramic images to comprehensively assess the maxillofacial region at a glance, many radiographic findings observed in these images are still not fully understood or clearly interpreted. In this regard, panoramic radiography continues to encompass aspects that remain insufficiently elucidated, even in terms of its exact imaging principles.

This lecture aims to highlight essential radiographic findings that every dentist should be familiar with when interpreting panoramic images. Particular emphasis will be placed on cases referred to tertiary care hospitals, focusing on key diagnostic features that require careful evaluation. Through case-based discussions, this presentation seeks to enhance the appropriate use of panoramic radiography as an important diagnostic record.

In addition, practical approaches for identifying high-quality panoramic images will be discussed, along with recent advancements in artificial intelligence-assisted interpretation.

### Profile

- \* Board-certified Specialist in Oral and Maxillofacial Radiology
- \* Clinical Assistant Professor & Clinical Instructor, Yonsei University Dental Hospital
- \* Assistant Professor, Yonsei University Dental Hospital
- \* Associate Professor, Yonsei University Dental Hospital
