

My Prescription Recipes

Dr. Young Taek Kim

The objective of this presentation is to discuss how different modalities of antibiotics/antimicrobials can be used to more effectively eliminate bacteria in the body and periodontal pockets, and to discuss how to utilize the different medications currently on the market.

We will discuss the appropriate regimen based on the severity of periodontal disease or periodontal abscess, the use of different antibiotic modalities such as sub-dosal doxycycline and local delivery antibiotics, and the efficacy of some of the more controversial gum products on the market.

Other common mouthwashes and toothpastes are also discussed in this lecture.

There are many medications available in the dental community in various forms that are often underutilized, and this lecture aims to summarize them in a way that makes them easier to use clinically.
