

Bridging preclinical evidence and clinical application of PDRN in dentistry

Prof. Hyun Chang Lim

Interest in polydeoxyribonucleotide (PDRN) is steadily growing within the dental field. Given the effects of PDRN, such as anti-inflammatory, pro-angiogenic, and tissue-regenerative properties, it holds significant promise for enhancing dental treatment outcomes. However, PDRN remains an off-label application in dentistry, and the evidence base supporting its use is currently limited compared to other materials. This lecture aims to explore the potential of PDRN in dentistry, based on relevant literature.

Profile

- * Resident, Department of Periodontology, Yonsei University Dental Hospital
- * Fellow, Clinical research assistant professor, Department of Periodontology, Yonsei University Dental Hospital
- * University of Zürich, Center of Dental Medicine, Clinic of reconstructive dentistry, Research Scholar
- * Visiting professor, University of Zürich, Center of Dental Medicine, Clinic of reconstructive dentistry / Thammasat university, Center for Implant Dentistry and Periodontics
- * Present, Associate Professor, Department of Periodontology, Kyung Hee University College of Dentistry
